Subject: Credit stacking example

Hi Claire,

I now more fully understand your question/confusion about our credit stacking example (SC35 50ft of the buffer for temp, 10 feet for nutrients). I do think it is complicated to think about how credits would be allocated in that scenario. Honestly, we haven't had to work through that yet. What if we replaced it with...

"Alternatively, the project site can be spatially separated so that different portions of the project site are used to generate different benefits. For example, if a cover crop will be applied across 4 – 25 acre fields, , a project developer can designate 2 of those fields (50 acres) for nitrogen credits and the remaining 2 fields for phosphorus credits. "

In this case, the subsections are much larger, so it's a bit easier to imagine they are each generating a suite of benefits that can be seperated from the other. Mostly, I'm looking for something simpler so that it does not raise the issue as much.

Carrie
